

## **Stem Cell Technologies**

### **Drug Free – All Natural Healing**

The media today is full of stories about the exciting field of stem cell technology and the advances made in human medicine.

**This technology is now available for your pet.**

#### **How Stem cell Therapy works**

All mammals have adult stem cells lying dormant in their body. These are activated naturally by the body when injury or tissue damage occurs. The damage may range from cuts and bone fractures to organ damage caused by disease, trauma or toxicity. The body sends a message from the site of the injury to activate the localised stem cells.

Once activated, these unique stem cells migrate quickly to the area in need and are then able to transform into the cells that have been damaged.

These cells could be tendons, ligaments, joints, cartilage, bone, skin, eyes – even nerves.

Extensive human research has led to the development of **StemVet™** for the animal world.

#### **The good news for you is – it's all natural.**

An IV injection of **StemVet™** assists with the activation and mobilization of a much larger quantity of activated stem cells, drawn from throughout the body and transported directly to the site of the injury.

This results in much faster and more accurate healing of the damaged area with less scar formation.

The body does not use up its supply of dormant stem cells – it simply reproduces more.

Researching the range of areas where this emerging technology can be used is the focus of ongoing research.

However, dramatic improvement has already been shown to occur in the treatment of the following conditions:

- Chronic arthritis
- Slow healing wounds, bone fractures or tendon injuries
- Damage to organs from disease, poisoning or accident
- Post surgery to speed up healing
- Infertility in breeding animals

This technology will not change any genetic or cancerous conditions. It's only useful when tissue is damaged.

For more information about how stem cell technologies can help your pet's condition – please ask your vet.

**StemVet™ is NOW available through our practice.**
